useradd vs. adduser

useradd:

useradd is a Linux command for creating a new user. It requires various options to add and set up an active user account. it allows changing default values for the user creation process. Such as id.

sudo useradd -m -g FamilyName -G pgroup ahmed_abdalla -d /my_ahmed

adduser:

it creates a home directory, adds the default shell as Bash.

it doesn't provide much control over the user creation details.

adduser is unavailable on all Linux distributions and, therefore, not portable.

sudo adduser ahmed_abdalla
